

WORKING WITH

evolution wireless G3

A SIMPLE TO USE, COMPREHENSIVE GUIDE
TO SETTING UP, CONFIGURING AND USING
EVOLUTION WIRELESS G3 SYSTEMS.

**APPLICABLE FOR USE IN THE U.S.
CONSUMER ALERT**

Most users do not need a license to operate a wireless microphone system. Nevertheless, operating a microphone system without a license is subject to certain restrictions: the system may not cause harmful interference; it must operate at a low power level (not in excess of 50 milliwatts); and it has no protection from interference received from any other device. Purchasers should also be aware that the FCC is currently evaluating use of wireless microphone systems, and these rules are subject to change. For more information, call the FCC at 1-888-CALL-FCC (TTY: 1-888-TELL-FCC) or visit the FCC's wireless microphone website at:

www.fcc.gov/cgb/wirelessmicrophones

Introduction

Wireless microphone and instrument systems have rapidly become standard equipment for musicians, Sennheiser's evolution wireless systems are the standard for musicians, broadcasters, theatre productions, reality television shows, and sound contractors alike. Sennheiser is the leading pioneer of wireless systems and over the years created Emmy Award-winning advances in the field of RF wireless technology. Sennheiser is proud to apply that same technology to the evolution wireless range of products which fit comfortably into virtually any budget. Traditionally, most wireless systems have offered the user a choice of fixed frequencies within a range of available VHF or UHF frequencies. While this approach makes for easy frequency selection, it offers little or no flexibility in circumventing interference or designing complex systems. Sennheiser evolution wireless G3 systems avoid the problems associated with RF (radio frequency) interference by being capable of tuning to a wide range of available UHF frequencies (up to 1,680 tunable frequencies). In addition, evolution wireless G3 systems offer easy and reliable system setup with the "Easy Setup" function. "Easy Setup" allows a receiver to scan the built-in frequency presets, choose a free one, and then program the transmitter over a wireless infrared link. These presets are specifically calculated not to interfere with each other, an undesirable effect which is known by the technical term "intermodulation." Because of their frequency agility, Sennheiser wireless systems give the user great flexibility to select available frequencies, even in the most complex multi-channel setups. This is ever important now and in the future as we see our RF environment populated by digital television stations as well as the likely possibility of other devices utilizing the UHF RF spectrum.

In addition, Sennheiser wireless systems feature a variety of versatile components and accessories which allow the user to adapt a system to nearly any imaginable need. From small-venue clubs and boardrooms to Broadway stages and stadium-sized concert halls, Sennheiser wireless is used with confidence every day by users the world over.

About UHF Wireless Systems

- **UHF** (Ultra High Frequency) transmission, the most popular format today, operates in the 470–698 MHz range. Because of its higher frequency range, UHF is not as susceptible to the interference typical of the VHF range, and is therefore a more stable format. Additionally, UHF systems are more convenient as they have shorter antennas than VHF systems.

The Parts of a Wireless System

Every wireless system consists of at least three parts:

1) Transmitter

A transmitter which accepts the source input signal (mic or line), converts it into an RF (radio frequency) signal, and transmits it to the receiver.

G3 SKM Handheld Transmitter

G3 SKP Plug-On Transmitter

G3 SK Bodypack Transmitter

2) Receiver

A receiver, which receives the RF signal from the transmitter, converts it back into an audio signal which is linked to the output for mixing and amplification.

G3 EM Rack-Mount Receiver

G3 EK Camera-Mount Receiver

3) Antennas

Antennas are the transmission path for the transmitter to send the signal to the receiver and also for the receiver to pick up the transmitted RF signal. These may be either active or passive antennas, determined by the system configuration.

A1031-U
Passive Omnidirectional
UHF Antenna

The Transmitter

The transmitter has a fairly straightforward job: to take the source input signal from a microphone or line-level input (a guitar, for example), convert it into an RF signal, and transmit it. It sounds easy, but there are a number of variables involved in producing accurate and dependable transmissions.

While many other wireless systems use transmitters that may have enough power to work well on a small stage, they lack the operating range and performance for a professional event. With this in mind, Sennheiser transmitters are intentionally engineered to provide more than enough output power for virtually any application. Sennheiser equips the evolution wireless G3 series of transmitters with 30 mW of output power for at least 300 feet of range (line of sight). As a result, the user gets increased range and strong, stable transmission regardless of the conditions. Additionally, all of our transmitters feature metal housings, making them capable of enduring life on the road.

Most importantly, a transmitter must be able to convert the audio signal into an RF signal without losing sound quality or accuracy. Any time a signal is converted from one type (analog audio) to another (RF, for example) there is a danger of losing some aspect of the original sound or adding unwanted noise in the transition. To guard against this, Sennheiser employs a proprietary noise-reduction system called HDX™. HDX™ circuitry allows the transmitter to produce an RF signal that maximizes the microphone's signal-to noise ratio while avoiding the RF noise inherent in most systems. Once the transmitted RF signal reaches the receiver, it is re-converted into analog audio (using reciprocal receiver-side HDX™ technology) with stunning accuracy and quality. This results in audio that sounds as good as that of a wired microphone. As a result, Sennheiser G3 systems have an amazing frequency response of 25 Hz to 18 KHz (line).

Types of Transmitters

There are four basic types of wireless transmitters:

1) Bodypack transmitter

A bodypack transmitter is a versatile transmitter platform that can be used with a wide variety of input options. Sennheiser evolution bodypack transmitters (SK100G3, SK300G3, and SK500G3) all offer adjustable input sensitivity controls and can be used with both mic-level sources, such as lavalier or headset microphones, and also high-impedance line sources, such as electric or acoustic guitars. Because of their compact and rugged design, bodypack transmitters are widely used with lavalier microphones (ME2 Omni, ME4 Cardioid), and headsets (ME3-ew). Applications range from musical and theatrical stages everywhere to use on film and television sets.

ME3 Headset Mic

ME4 Lavalier Mic

G3 SK Bodypack Transmitter

2) Handheld transmitters

Handhelds are the most recognizable of transmitters since they most closely resemble traditional wired microphones. Evolution wireless handheld transmitters (SKM100G3, SKM300G3, and SKM500G3) are specially designed to stand up to the rigors of live performance and offer exceptional sound. Sennheiser evolution wireless G3 handheld transmitters contain user-swappable dynamic and condenser elements, so one can easily adapt or upgrade the type of microphone capsule to a different type.

G3 SKM Handheld Transmitter

3) Plug-on transmitters

Plug-on transmitters are unique in that they convert a traditional wired microphone or line level signal into a wireless device. The plug-on transmitter in the evolution G3 line is the SKP100G3. This works for most plug-on applications, but does not provide 48v phantom power to those microphones which require it (see SKP2000 in the 2000 series for this). Plug-on transmitters are widely used for on-location newscasts, reality TV, movie sets, and also for sending outputs from mixing consoles to other Sennheiser receivers. For example, many wedding videographers ask the DJ or band if they can plug in their SKP100G3 and as a result send the sound directly to their camera or audio recording device.

G3 SKP Plug-On Transmitter

Since portable wireless transmitters are meant to roam around, they require battery power in order to work. Users should always use quality alkaline batteries for full power and longevity. Sennheiser's battery technology in evolution wireless products maintains a constant system voltage; therefore there is zero performance degradation as the batteries run down from use. If the device is on, the sound and range are still 100% as you would expect from new batteries regardless of battery level. All evolution wireless G3 portable transmitters and portable receivers also have charging contacts for use with the optional BA2015G2 battery and L2015G2 charger (except SKP100G3). For convenience, evolution wireless G3 transmitters feature convenient built-in battery gauges that allow the user to see the current battery level at a glance, so he or she can avoid running out of power. New for G3 is a standard feature called "battery telemetry" which simply means one can also see how much power is left in the transmitter by looking at an indicator from the receiver. This is extremely valuable for sound engineers who are curious how fresh the batteries are in a transmitter which may be already in use and not easily accessible.

4) In-ear monitor transmitters (rack mount)

In-ear monitor transmitters accept an audio signal, typically from a mixing console, and send it wirelessly to a portable receiver which a performer typically wears on their hip. The SR300IEMG3 is the half-rack spaced size transmitter in the evolution wireless G3 series.

G3 SR300IEMG3 Rack-Mount Transmitter

The Receiver

The brain of every wireless system, the receiver, is designed to receive the RF signal from the transmitter, convert it back into an audio signal, and output it to a PA system or audio device for mixing, recording, and amplification.

All Sennheiser wireless EM rack-mountable receivers employ True Diversity technology to ensure stable, uninterrupted wireless reception free from signal dropouts. In a True Diversity setup, a receiver features two independent receiver sections, each with its own antenna (rather than a single receiver module with a single antenna). By means of a comparison circuit, the receiver simultaneously checks both receiver sections many times a second and seamlessly selects the section with the strongest signal. This helps maintain a stable, high-quality signal, significantly reducing the possibility of dropouts. A True Diversity receiver typically costs more to design and manufacture than other “antenna switching” diversity systems, however Sennheiser has always been committed to bringing you the very best.

Another quality which distinguishes evolution wireless G3 receivers is their robust metal construction. In order to protect the sophisticated electronics inside and to provide professional road worthiness, evolution receivers are housed in metal, rather than in the plastic shells used in many other wireless systems. The benefits are obvious: exceptional durability and dependability, even in the roughest conditions.

Fixed receivers

There are three basic types of wireless receivers:

1) The fixed (rack-mount) receiver

The most common version, evolution fixed receivers (EM100G3, EM300G3, and EM500G3) are compact, half-rack sized units which can be mounted, along with optional AM2 front-mounted antennas, into a standard 19” equipment rack using the optional GA3 rack adapter.

G3 EM Receiver front view

2) Portable (camera-mount) receivers

Portable receivers are used specifically for film, television, and video applications in which a performer or newscaster is using a wireless transmitter and there is a need to send this back to a video camera or recording device. The EK100G3 is an example of a portable receiver. Portable camera-mount receivers are compact, lightweight, battery powered, and can be mounted directly onto a wide variety of motion-picture or video cameras which have a standard shoe mount for accessories.

G3 EK Camera Mount Receiver

3) In-ear monitor receivers (performer worn)

In-ear monitor receivers are worn by musicians to hear themselves and other instruments while performing. This concept allows the performer to hear their performance clearly while simultaneously keeping the stage volume down which reduces the risk of feedback. Many enjoy the fact they can hear clearly without straining to hear as you would when using conventional monitor wedge speakers. The EK300IEMG3 is the in-ear monitor receiver featured in the evolution wireless G3 series. This receiver is battery-powered and can receive a stereo, mono, or dual mono signal from a rack mounted transmitter (SR300IEMG3). These receivers have a large, easy-to-use knob to adjust volume during performance – robust and simple.

An exciting new feature for both the Sennheiser EK100G3 portable (battery powered) camera receiver and the EK300IEMG3 in-ear monitor receiver is called Adaptive Diversity. Adaptive Diversity means the receiver utilizes the output cable as a secondary antenna to ensure stable and uninterrupted wireless reception.

G3 EK In-Ear Monitor Receiver

Perhaps the most distinctive feature of evolution wireless systems is their proprietary HDX™ compander circuitry. Engineered to our exacting sound specifications, HDX™ is a sophisticated noise-reduction system that maximizes the microphone's dynamic range while minimizing undesirable sound artifacts and transmission noise. By compressing the audio in a 2:1 ratio (related to dB), an HDX™ compressed signal is transmitted above the level of noise inherent in the RF link. The result is remarkably clear, full sound with a better signal-to-noise ratio than a CD. The evolution wireless G3 series utilizes HDX™ technology to achieve an amazing 25 Hz – 18 KHz frequency response (line). With its HDX™-enabled components, evolution wireless G3 offers the freedom and ease of wireless without any compromise in sound quality. While digital wireless systems do not contain a compander circuit, they are subject to limited channels of operation due to the larger required bandwidth of the transmission link. Sennheiser HDX™ offers near-perfect audio reproduction while remaining flexible to have numerous channels operating simultaneously.

Once a receiver has translated the transmitter's signal back into an audio signal, it needs to provide adequate output options for mixing and amplification of the signal. evolution receivers feature a complete set of 1/4" unbalanced and XLR outputs on all systems, which allow easy interfacing with any PA system.

Sennheiser integrates many powerful new features into the G3 series of receivers. The EM100G3 and EM500G3 both feature an onboard guitar tuner for convenience. A convenient front-panel headphone monitor output with volume knob is standard on the EM300G3 and EM500G3 receivers. This headphone output is handy for an engineer to check the quality and level of the audio from its transmitter before it is even routed to a mixing console or other device.

G3 systems also now introduce infrared syncing of transmitters which makes setup very easy. Once a receiver is set to an open channel, a push of the "Sync" button allows it to send the frequency and other parameters over to the transmitter in a flash. This simplifies setup time and takes the hassle out of programming transmitters. One push and a few seconds is all it takes.

The EM300G3 and EM500G3 receivers feature a unique Soundcheck Mode, which allows a user to conduct an accurate, quick on-stage RF and AF level check with a single microphone—without any assistance. The EM500G2 also offers a convenient front-panel Headphone Monitor Output, for easily checking the quality and level of the signal received from its complementary transmitter. The 300 and 500 series' Channel Naming function provides a convenient way to identify channels at the receiver. In addition, a Peak-hold Display provides quick and accurate level monitoring.

The Antenna

For most basic wireless applications, the antenna supplied with a system's receiver is more than adequate. As your wireless system grows, however, you may find you require one or more remote antennas to accommodate the increased number of channels. Receivers in large setups are most often rack-mounted. If the antennas are left inside the rack, performance can be degraded due to the rack and metal housings in the transmission path. Remote antennas allow the receiver antennas to be placed in a location which provides better reliability and reception.

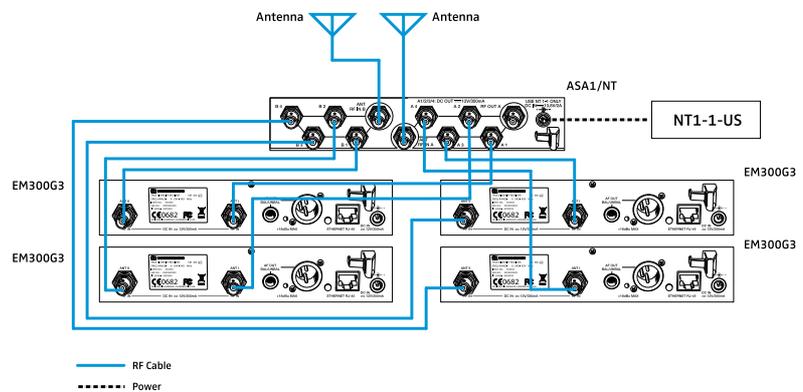

Diagram illustrating the ASA1's ability to feed multiple modules.

In order to manage additional antennas, Sennheiser offers a variety of useful tools. Antenna splitters, such as the ASA1, allow a single pair of antennas to “feed” multiple receivers. The new active ASA1 allows wideband splitting of antennas and can be daisy chained for use with multiple channel setups. Because the ASA1 is active, boosters are typically not required unless the antenna cable runs are in excess of about 90 feet.

Antenna combiners, such as the AC3, are similar to splitters but are used only with wireless monitoring systems to combine up to four transmission signals onto a single transmit antenna.

Both the ASA1 and AC3 power the G3 receivers/transmitters they are connected to right through the antenna cable – a cool concept!

A1031-U

Passive, omni directional UHF antenna which can be mounted on a stand. Receives/transmits signals in a Taurus or “donut” shaped pattern.

ASA1

1:4 active antenna splitter. Allows up to four receivers to operate off a pair of antennas.

Wireless Monitor Systems

Another revolution in the world of live sound is the widespread use of wireless monitor systems. Since such systems offer better signal-to-noise ratios without feedback, they provide the user with great freedom of movement and control. In addition, wireless monitor systems provide excellent hearing conservation since they do not need to be loud in order to “cut through the mix.” Add in great cost-efficiency, space-savings, and portability when compared to hauling ordinary monitors, and you can easily see why wireless monitoring is so popular.

The evolution wireless G3 monitor system is engineered with the same principles of high quality and durability as all other evolution wireless G2 systems. The SR300G3 transmitter features 1/4” and XLR balanced inputs for easy compatibility, and robust output power (30 mW) for extended range and signal stability. With preset UHF frequencies (from the user-selectable 1,680 available) and multiple channel operation, the system can provide wireless monitoring for every performer on stage. Engineers will love the built-in Ethernet port for computer control with Sennheiser WSM software for both PC and Mac computers. The unique Focus feature allows you to switch between standard stereo (2-channel) monitoring and Focus Mode, which provides limited mixing capabilities (the ability for performers to pan between their vocals and the instrumentation, for instance). Frequency number and channel number display functions provide clear indication, and the system’s channel Naming function allows you to add a custom name to each preset. In addition, convenient front-panel headphone monitoring allows for quick and easy monitoring of each channel’s signal.

The compact EK300IEMG3 bodypack receiver provides each performer with clear, interference-resistant monitoring. Like the transmitter, it features frequency number and channel number display and a Focus control, which allows the user to adjust the balance of the system's two channels to create a custom monitor mix. The receiver also features an adjustable Audio Limiter, which restricts volume to protect against hearing loss. The evolution Wireless Monitor System comes supplied with high quality IE4 stereo ear phones, which provide lightweight comfortable listening, but can also be used with custom ear molds (ordered separately) for the ultimate in wireless comfort, fit and performance.

Accessorizing a System

Sennheiser offers many useful accessories for the evolution wireless G3 series.

GA3 Rack Adapter

For convenient side-by-side mounting of up to two fixed EM receivers, SR transmitters, ASA1 splitters or AC3 combiners in a standard 19" rack.

AM2 Front Antenna Mount

For use with the GA3 for use with fixed receivers or transmitters in a standard 19" rack-mounting arrangement, the AM2 is used to mount antennas in the front. This enhances performance over having the antennas "buried" inside the rack.

ASA1 Antenna Splitter/DC Power Distributor

Active antenna splitter that feeds RF signal and DC power through the RG58 cable to up to four fixed receivers simultaneously. This reduces the number of antennas required and makes for a very "clean" installation. Two ASA1 units can be coupled to feed up to eight receivers from a single pair of antennas. More than eight receivers can be fed from a single pair of antennas when feeding the output of an ASA1 into two or more ASA1 units.

Component Requirements

Generally speaking, wireless systems are sold as sets which contain one transmitter and one receiver. If you require more than a single transmitter or receiver, there are several important points you must consider. First, a transmitter and receiver must be able to tune to the same frequency in order to work together. For example, a VHF transmitter cannot work with a UHF receiver. Secondly, transmitters and receivers must both use the same compander circuitry in order to work together. Since the transmitter's compander circuit dictates the way the audio is "compressed" into an RF signal, the receiver on the other end must have compatible circuitry to "uncompress" the RF signal into a high-quality audio signal. evolution wireless systems employ Sennheiser's proprietary HDX™ compander circuitry for superior signal-to-noise ratios and quiet operation. evolution components can only be used with other HDX™-enabled Sennheiser components. Because of the flexibility of HDX™, all evolution components are compatible with one another regardless of generation (G1/G2/G3) as long as you can tune to the same frequency. In addition, evolution components are compatible with the 2000 series. As a result, evolution wireless G3 offers a high degree of frequency agility in each range (1680 frequencies). This allows you to easily configure everything from a basic setup to large multichannel systems, depending on the surrounding RF environment.

Frequency Concerns

The successful operation of an RF wireless system depends greatly on two things:

- 1) The frequencies to be used must be free of interference from other signals in the air. Frequency agile wireless systems (those offering a high number of user-selectable operating frequencies) provide the most effective means of avoiding such interference.
- 2) The frequencies to be used must be calculated exactly to avoid interfering with each other. Not only do these frequencies need to be spaced apart far enough, they must also be carefully calculated to avoid creating harmonics which can cause other frequencies to have problems such as dropouts and static "hits." These undesirable effects are known as "intermodulation." G3 makes this simple by offering preset frequencies called "CHANNELS" which reside in a frequency "BANK." When operating multiple systems in the same frequency range (i.e. range "A" 518-558 MHz), you should always run these systems in the same BANK.

Although evolution wireless G3 is one of most frequency agile products on the market, care must be taken in selecting your systems' operating range and frequencies to insure that interference-free operation is achieved.

Location

Geographic location plays a major role in the effective performance of your wireless microphone and/or monitoring system. The primary source of airwave competition is from television broadcast transmission towers. It is very likely that most locations where a wireless system is to be used will be within the effective transmission range of at least one, if not more, of these television broadcasting stations. In planning your systems' frequency requirements, one should determine what frequencies are in use by local television stations.

Local television stations are not the only transmissions that may cause interference. Nearby wireless communication devices and other wireless microphone systems may also introduce obstacles when planning an effective wireless system. Having a complete knowledge of your RF environment (the possible sources of RF interference including their frequencies), as well as a functional frequency coordination scheme (using the BANK system) are very important when planning a wireless microphone system. Sennheiser's website ([HYPERLINK "http://www.sennheiserusa.com" www.sennheiserusa.com](http://www.sennheiserusa.com)) has an interactive frequency finder which can assist you in finding which local TV stations are broadcasting in your area.

Effective frequency coordination is a means of scientifically determining the compatibility of multiple RF systems operating simultaneously. It is recommended that you follow our frequency coordination schemes when planning a multi-channel wireless system within your RF environment.

DTV (Digital Television)

Now that the FCC has mandated that all television broadcasts are digital, it is more important than ever to ensure you are on a clear frequency. Additionally, portions of the UHF spectrum are now reallocated by auction and/or emergency operation. As of June 12th, 2010, the FCC has made it illegal to operate wireless devices in the 698-806 MHz range.

It's important to remember when incorporating evolution wireless G3 into a wireless system, that each evolution wireless G3 system is manufactured to operate within a particular frequency range (A, B, G etc.) Each range is broken down into 1,680 user-selectable frequencies.

Remember, we always want to run multiple systems in the same range (e.g. A, B, G) in the same BANK. You would use the same BANK but different channels under that bank. The number of preset channels per BANK depends on what series of evolution G3 you have. For example, the "LE" series has up to 6 channels per BANK while the 500 series has up to 32 channels per BANK. The following evolution wireless G3 frequency combination charts which also may aid in determining frequency compatibility if you are using evolution wireless G3 with wireless products made by other manufacturers. When using multiple evolution wireless G3 systems, it is important to make certain that all channels in your system follow this compatibility scheme to guarantee that your system will operate interference free.

Steps for Auto Tuning evolution wireless G3 Systems

1. On the receiver, press SET to enter menu. Press up/down buttons to select "Easy Setup". Press SET and choose "Scan New List." Press SET to start scan.
2. After the scan is completed the receiver will suggest a BANK to choose with the most free channels. Press SET. Now select a channel using the up/down arrows and press SET to confirm. The receiver will say "STORED."
3. Tap the POWER button to exit the menu. The frequency chosen will be displayed. You should see zero RF activity on the meter (meaning you are on a free channel).
4. Power up the transmitter you wish to pair with the receiver. Become familiar where the infrared (IR) window is located. On a G3 handheld transmitter, the window is located on the display. On a body-pack transmitter, it is located under the flap just to the right of the ON/OFF button.
5. Press the "SYNC" button on the front of the receiver and the receiver will enter SYNC mode. Simply hold the handheld or bodypack IR window facing the left side of the receiver display about 1" to 2" away.
6. If the SYNC is successful, you should see a check mark on the receiver screen. If you see an "X", it indicates the sync failed and you should repeat step 5.
7. After a successful SYNC, you should see the frequency match on both the receiver and transmitter.
8. If setting up another system in the same frequency range (A/B/G), you can repeat the process from Step 1. Just be sure to choose the same BANK number as you did in step 2 to ensure compatible operation, and a different channel number.

How To Use the Following Charts

These charts represent the tuning scheme of each range and are for reference in determining the suitability of a particular range for your geographic location.

Transmitters and receivers are available in a 42 MHz UHF frequency range with a total of 1,680 transmission/receiving frequencies. Transmitters and receivers have 20 frequency banks respectively. Each of the channels in the frequency banks has been factory-preset to a frequency. The frequency presets within one frequency bank are intermodulation-free. These frequencies cannot be changed. The frequency banks "U" (ew 100: bank "U", ew 300/ew 500: banks "U1"–"U6") allow the user to store individual frequencies which are freely selectable in 25-kHz steps. It might be that these frequencies are not intermodulation-free. The following table lists the frequency presets in the frequency banks "1" to "20":

Frequency Range A 516–558 MHz											
US TV Channel		Ch. 21 (512–518 MHz)	Ch. 22 (518–524 MHz)	Ch. 23 (524–530 MHz)	Ch. 24 (530–536 MHz)	Ch. 25 (536–542 MHz)	Ch. 26 (542–548 MHz)	Ch. 27 (548–554 MHz)	Ch. 28 (554–560 MHz)		
	Channel	Bank 1	Bank 2	Bank 3	Bank 4	Bank 5	Bank 6	Bank 7	Bank 8	Bank 9	Bank 10

Multi-channel Wireless Mic System Hookup

1. Rack mount your gear. The GA3 rack adapter can accommodate two half-rack sized units, such as a receiver, a splitter, or an AM2 kit (which includes two front mounts for antennas). Consider how many channels you will need, and select the appropriate number of GA3 units (see the sample drawings on the following pages to get an idea of how this works).
2. Determine whether you will need an antenna splitter(s) based upon the number of channels you require. A rule of thumb is that you will need a splitter for every four channels. If doing more than 8 channels, you will need to group them in groups of 4, or 8 units with another "master" ASA1 which takes the feed from the antennas. Another great advantage which splitters offer is that they will provide DC power to the receivers right through the connection cable. A single splitter will power up to four receivers.
3. Determine where you wish to place your antennas. If you wish to keep them at your rack, you will need an AM2 kit for every splitter you have, unless you optimize the cascading feature of the splitter, which allows the operation of eight receivers of the same frequency range from one pair of antennas. An AM2 kit front-mounts two antennas, and takes a total of 1/2 a rack – keep this in mind when configuring your system. If, instead, you wish to remote-mount your antennas to increase the coverage area, you will need to utilize A 1031-U antennas, which are typically mounted to mic stands or WM1 wall mounts. Since the antennas will be used away from the rack, it is not necessary to use AM2 kits.

Antenna Splitter and Mounting Packages

Considering the number of individual items required to rig an evolution wireless G3 receiving antenna splitter system, we have put together seven packages to make ordering these items simpler. These packages address seven common scenarios.

NOTE: The antennas supplied with all ew rack-mountable receivers are to be used only in chassis-mounted (rear jacks), or in conjunction with the AM2 front-mounting kit. These are ground plane devices and are never to be used as a remote antenna solution on the end of a cable.

Due to the variables in one installation to another, the following items are not included with Sennheiser splitter/combiner kits. It is suggested you check and see if you may require any of the following:

- GA3 rack mounts (which are not included with 100 series)
- RG58 cable to run to your antennas
- Mounting brackets for remote antennas
- Rack screws

The following is a list of splitter and antenna kits that Sennheiser currently offers for G3 units:

G3OMNIKIT4

Active splitter kit for four receiver system using omni-directional remote paddle antennas, includes ASA1/NT, two A1031-U, GA3

G3OMNIKIT8

Active splitter kit for eight receiver system using omni-directional remote paddle antennas, includes two ASA1/NT, two A1031-U, GA3, two BB1

G3DIRKIT4

Active splitter kit for four receiver system using directional remote paddle antennas, includes ASA1/NT, two A2003-UHF, GA3

G3DIRKIT8

Active splitter kit for eight receiver system using directional remote paddle antennas, includes two ASA1/NT, two A2003-UHF, GA3, two BB1

G3FRONTKIT4

Active splitter kit for four receiver system using front-mount antennas, includes ASA1/NT, GA3, AM2

G3FRONTKIT8

Active splitter kit for eight receiver system using front-mount antennas, includes two ASA1/NT, two GA3, AM2, two BB1

ASA1/NT

Active antenna splitter with DC power distribution for G3 receivers, includes required NT1-1 US power supply and eight 20" BNC cables

AC3/NT

Active antenna combiner with DC power distribution for IEM transmitters, includes required NT3-1-US power supply and four 20" BNC cables

G3IEMDIRKIT4

Active combiner kit for four IEM transmitters with DC power distribution, includes AC3/NT, GA3, A2003-UHF

Putting Together a System

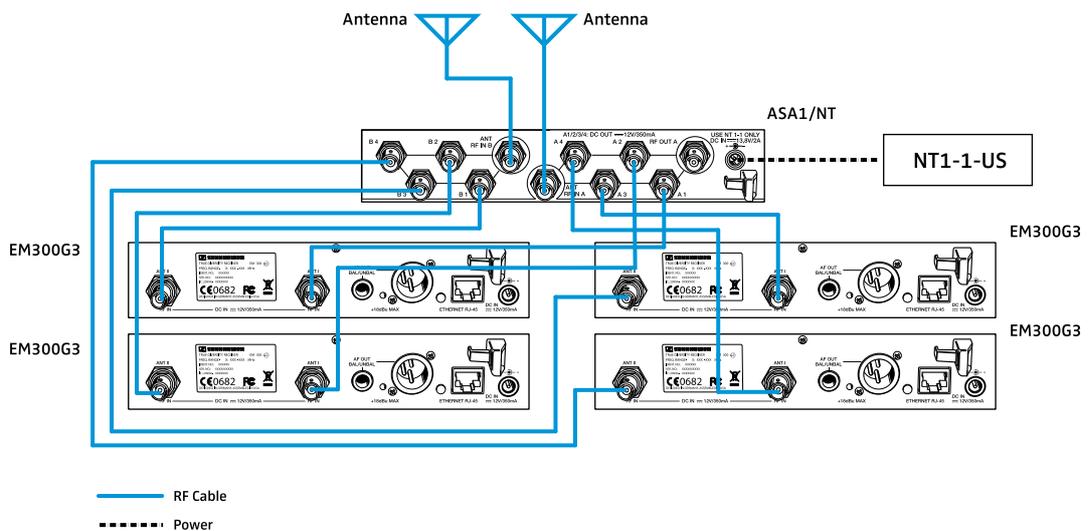

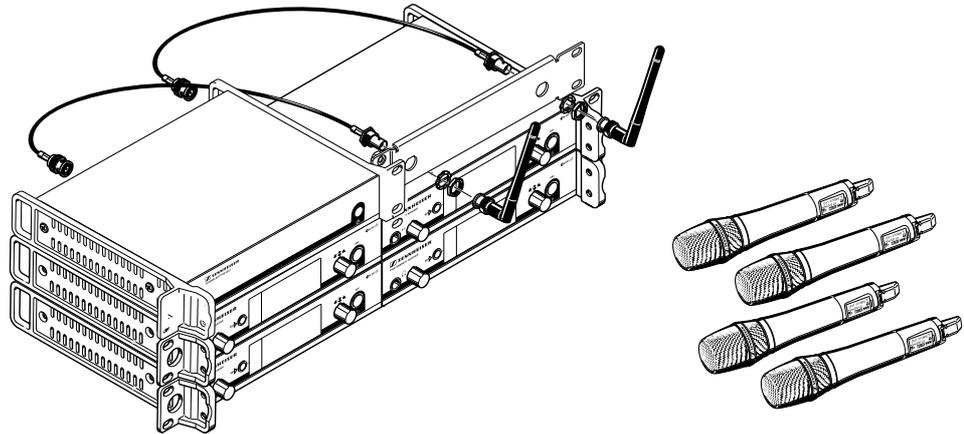

Following are diagrams of several typical wireless microphone and wireless monitor systems.

NOTE: For systems larger than 8 channels, we recommend using Sennheiser's 2000 Series wireless: http://www.sennheiserusa.com/professional_2000-series-wireless

Four Channel Wireless System

(4 Handheld Systems)

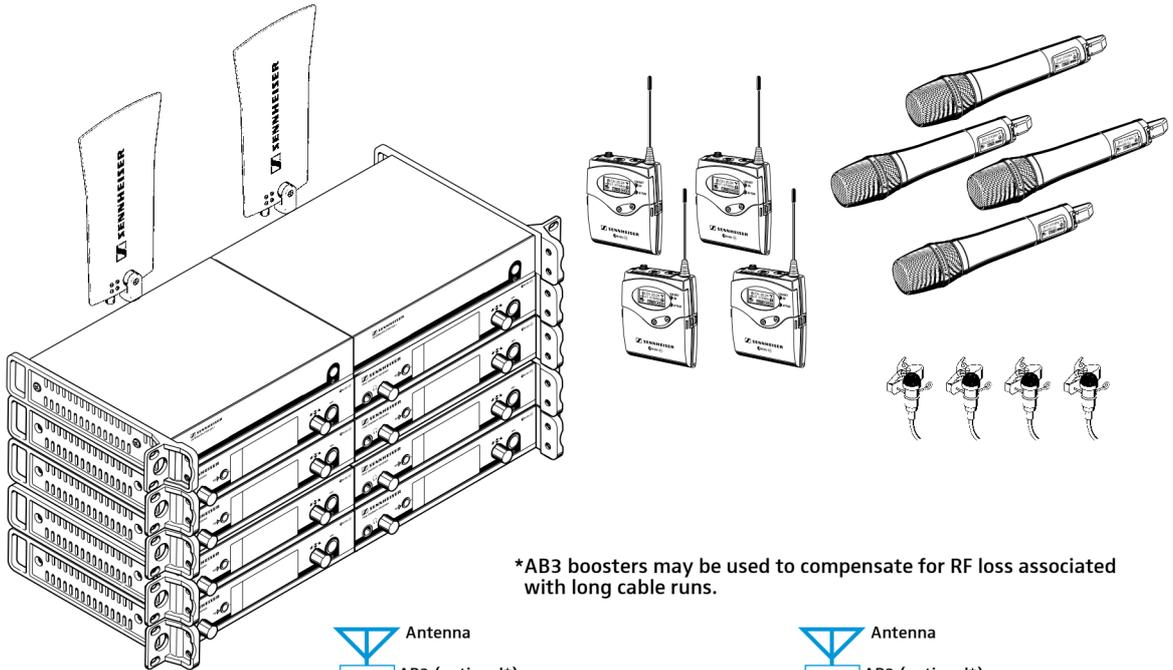

Qty	Model	Description
4	ew335G3	Handheld Systems w/MMD 835-1 capsules
1	G3FrontKit4	Active splitter kit for four receiver system using front-mount antennas, includes ASA1/NT, GA3, AM2

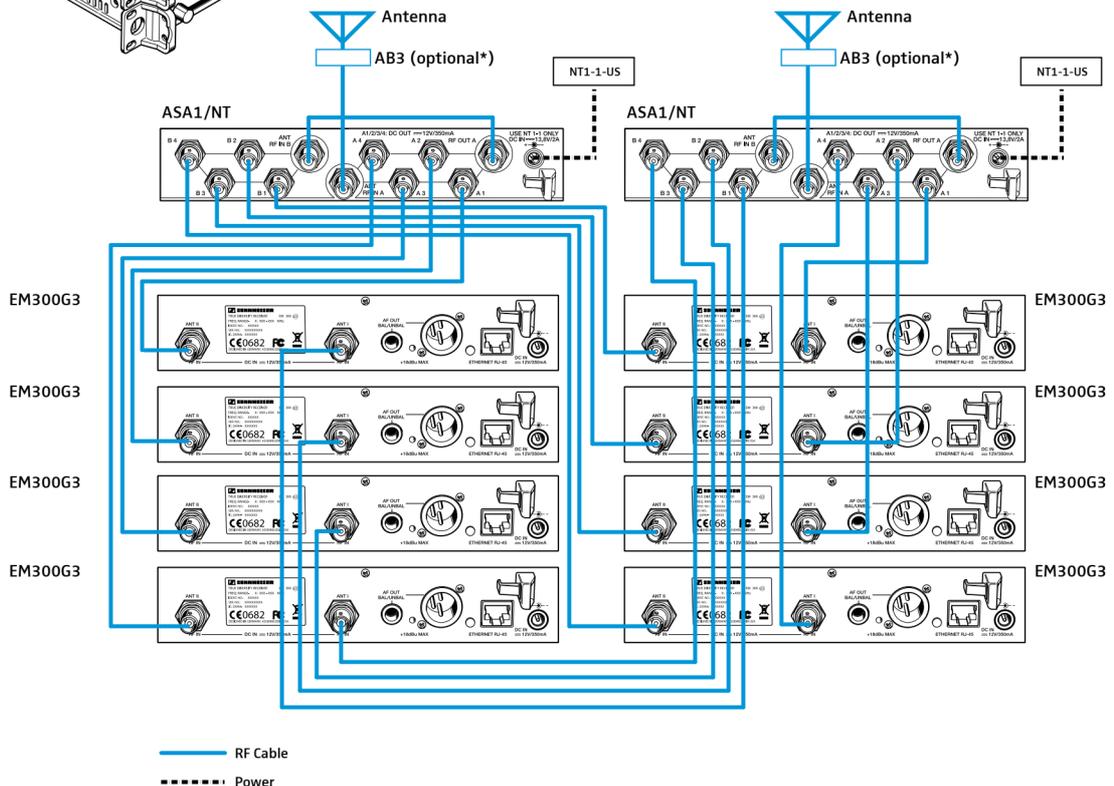

Eight Channel Wireless System (4 Handheld Systems and 4 Lavalier Systems)

Qty	Model	Description
4	ew365 G3	Handheld Systems w/MME865-1 capsules
4	ew312 G3	Lavalier Systems w/ME2 capsules
1	G30mniKit8	Active splitter kit for eight receiver system using omni-directional remote paddle antennas, includes two (2) ASA1/NT, two (2) A1031-U, GA3, two (2) BB1

Note: Various Lengths of RF cable available for antenna run (sold separately)

*AB3 boosters may be used to compensate for RF loss associated with long cable runs.

Frequently Asked Questions

Where's the mute switch on the handheld?

100 and 500 Series (as well as 2000 Series) SKM handheld transmitters do not have a "Mute" button due to the fact that true professional microphones (wired and wireless) usually do not have a mute button. Nonetheless, if you press the power button quickly, you will have the option to enable RF Mute on the hand held. This is a two-button operation (press the Power Button momentarily, then use the jog wheel to confirm the RF Mute).

The G3 300 Series SKM Handheld transmitter has a programmable button – this is labeled "Mic" button instead of a "Mute" button because it can serve multiple functions (see below). You can program this model to have the mute latch on/off, or be momentary such as "push to talk" or "push to cough." In addition, you can disable it entirely.

Can I use regular "AA" rechargeable batteries?

Yes. Regular rechargeable batteries (NiMH) will function just fine in your G3 system. The only caveat is that the battery meter may show a low battery status more quickly due to the lower voltage that rechargeable batteries produce. Keep in mind that most G3 portable components have charging contacts for use with the Sennheiser BA2015G2 battery pack and L2015G2/NT charger. It should be known that these contacts will not function with any other battery pack except the BA2015G2.

My wireless system is on and functioning, however I am experiencing feedback and poor sound quality through my PA system. What is the issue?

From the factory, G3 rack mount receivers come with the output level set at +18dB. This is a very strong signal and can result in feedback and poor sound quality with certain mixing consoles and amps. To remedy this, you can adjust the "AF OUT" menu on the receiver to a lower number. It is recommended to start at around "00 dB" and perhaps "+3 dB or +6 dB" depending on your application. These are guidelines, so feel free to experiment to get the best sound possible from your particular system.

Why does my PA system or camera emit a horrible loud static noise when I power off my transmitter?

This simply means you are on a frequency which is already in use, most likely by a television station. When the transmitter is on, everything is working just fine because of the close proximity of the transmitter and receiver. When the transmitter is powered off, the receiver no longer hears the transmitter and tries to latch onto any signal it can find on that same frequency.

If you see RF activity on the display meter with the transmitter powered off, it means that there is another signal on the same frequency interfering with your system (most likely from a TV station). You can use the "Easy Setup" to "Scan New List" and find a new free frequency. Once you select a free frequency, this loud static noise will no longer come through your system when the transmitter is powered off. If you use your system in various locations, it is always a good idea to redo the "Easy Setup" to find a free frequency as the RF environment will change depending on geographical location. Another temporary solution which works sometimes would be to raise the "Squelch" setting from the default "Low" setting to either "Med" or "High." Raising the Squelch level means that the receiver will expect more RF signal before it unmutes. This is a temporary solution, and should only be used as a last resort as raising the squelch also reduces your operating range. It is always better to find a free frequency instead.

Why doesn't my right angle Ci1-R cable work with my new G3 system?

The Ci1-R cable which was sold for G2 was manufactured for Sennheiser by a 3rd party and it was recently discovered that the cable did not meet our exact wiring specification. While this worked fine for G2, it will not work satisfactorily for G3. There is a new model Ci1-R which has the model number "Ci1-R EW." The Ci1-R EW will work on all generations of evolution wireless systems and it can be identified by a gray piece of shrink tubing located at one of the connectors.

AF and RF Mute – what's the difference?

One of the great new features with G3 transmitter body packs is the option for the user to select either an AF Mute (audio frequency) or an RF Mute (radio frequency) option. An AF Mute is the traditional way to mute your audio signal, this is what G2 offered. The RF Mute is different in that it will not only mute the audio to the receiver, but it will take the transmitter carrier off air (remember: you can never have two transmitters on the same carrier frequency at the same time!). This is particularly important for back-up transmitters and guitarists/bassists that have multiple guitars and only one receiver. You can outfit all of your guitars with transmitters on the same frequency and leave them powered on. With RF mute activated, you can simply slide the "Mute" switch on or off and switch guitars quickly. No more powering on or powering off packs.

What are the advantages of Low Power mode on 300/500/2000 Series (& SK 5212)?

In many instances, users think more power is better but, with respect to wireless systems, "just enough" power is best. The stronger your RF output power is, the greater chance your systems may have issues with interfering with other wireless systems. Higher output power also makes it more difficult to deploy large multi-channel systems. It will be possible to achieve higher channel counts in a 42 MHz switching bandwidth by decreasing your RF output power and utilizing properly designed antenna systems.

What is cable emulation?

Cable emulation is a feature which is available on the SK 100 G3, SK 500 G3 and SK 2000 bodypack transmitters– this function allows you to virtually adjust the cable length which the guitar pickups see. It is common knowledge that the longer a corded guitar cable is, the more high frequency loss will occur due to capacitance inherent in the cable. Capacitance can also "load" your pickups and cause them to react differently. When guitarists move from traditional cables to a wireless system, sometimes the wireless system can sound almost "too clean" due to the fact the Sennheiser wireless audio transmission matches or exceeds the Compact Disc quality. Cable emulation allows you to "dial" back in the familiar capacitance and treble roll-off which a performer may consider to be a part of their overall sound.

Why can't I front-mount my antennas on the GA3 rack ears? The rack rails seem to get in the way of the two holes.

To rack-mount the antennas on a full 19" rack unit, you will need the GA3030-AM accessory. This accessory includes two rack handle mounting pieces that will enable you to attach the female BNC bulkhead to the rack, right where there are already drilled and tapped threads. The antenna cable will pass through the rack mount, via the holes, to the back of the receiver where it will connect. More common is the use of the GA3 with the AM2. This allows one to rack mount a single system and place the antennas in the same rack space on the included blank panel.

Frequently Asked Questions (Continued)

How do I use the built-in guitar tuner on my 100 or 500 series G3 receiver?

Simply bring up the menu by pressing the "SET" button. Find the "Advanced" section and press "SET" once more. In this menu you will find the guitar tuner option. Select it by using the "SET" button and change it from the "Inactive" setting to either "Active" or "Audio Mute." Once this is done, you can tap the power button to exit to the main operating screen. By pressing up/down on the arrows (100 series), or by moving the jog wheel (500 series), you can see the tuner on the screen. If you have the tuner setting to "Active," this means the tuner will always pass through the audio. If you set the tuner to "Audio Mute," this means that when you are on the Tuner screen the receiver will mute it's audio output. This is handy if you wish to tune in silence.

Conclusion

As we progress into the 21st century, it is a given; wireless systems are everywhere. Each time we turn on a television, see a performance, watch the news, go to the theatre, or enjoy a concert, we are surrounded by wireless technology. We almost take it for granted. Sennheiser is proud to embrace this movement and place this technology in reach for those who want a high-performance product which is also easy to use. We understand that wireless systems allow you to express yourself to your audience without being constrained by wires.

Sennheiser evolution wireless G3 systems not only showcase breakthrough features, but they are also easily adaptable as your needs change. As long as you can tune each component to the same frequency, you can mix and match previous generations of evolution wireless with current G3 models.

While there will always be certain sophisticated applications which require assistance from the manufacturer, evolution wireless G3 systems are ready to perform right out of the box. With exceptional clarity, extended range, and proven durability, they are truly the best choice for affordable, professional wireless performance.

For additional information about evolution wireless G3 or other Sennheiser products, please contact Sennheiser at 860-434-9190, or log onto our Website at: www.sennheiserusa.com
